NETO Instructions for test users

As part of my Masters Project at Stanford University, I am doing tests of the usability and educational value of the New Employee Technical Orientation. We want you to work on two modules in the course. The goal is to better understand the ways in which the course design helps and hinders learning of strategic knowledge.

In order to best understand what is going on, it will be really helpful if you discuss what you are doing with each other as you are doing it. The more I can hear about your thinking, the better I'll be able to understand how well our approach works. I will not answer questions about how you should do things (the whole point is to see how you go about figuring them out), but will be glad to clarify anything about the experiment as we go along.

We will give you about 15 minutes to work on each module. Do not worry if you do not “finish” the module in that time. Afterwards, we will take a few minutes to discuss what you did and what you thought while you were doing it.

Thanks for your help!
